#### Abstract

This paper discusses about the properties between complete fuzzy graph and some operations on fuzzy graph like Cartesian product, symmetric difference, complement, conjunction, disjunction and rejection.

## 1. Introduction

Zadeh [12] introduced fuzzy sets in 1965 to represent/manipulate data and information possessing non-statistical uncertainties. It was, particularly, designed to mathematically represent uncertainty and vagueness and to provide formalized tools for dealing with the imprecision intrinsic to many problems. But it was Rosenfeld [10] who considered fuzzy relations on fuzzy Received: May 7, 2014; Revised: June 28, 2014; Accepted: September 5, 2014

2010 Mathematics Subject Classification: 05C72, 05C76.
Keywords and phrases: complete fuzzy graph, operations on fuzzy graph, neighbourly irregular fuzzy graph, isomorphism.
sets and developed the theory of fuzzy graphs in 1975. Rosenfeld has obtained the fuzzy analogues of several basic graph-theoretic concepts like bridges, paths, cycles, trees and connectedness and established some of their properties. There are several operations on $G_{1}$ and $G_{2}$ which result in a graph $G$ whose set of points is the Cartesian product $V_{1} \times V_{2}$, where $V_{1} \times V_{2}$ is the point set of $G_{1} \times G_{2}$. These include the Cartesian product, the composition and the tensor product. Other operations of this form are developed in Harary and Wilcox [3] and they investigated some invariant properties of them. Operations on (crisp) graphs such as conjunction, disjunction, rejection and symmetric difference were extended to fuzzy graphs and a methodology is proposed to find the resulting fuzzy graphs of the same operations using adjacency matrices of $G_{1}$ and $G_{2}$ [7]. Bhutani [1] introduced the notion of weak isomorphism and isomorphism between fuzzy graphs. Nagoorgani and Malarvizhi [8] discussed the order, size and degree of the vertices of the isomorphic fuzzy graphs. Nagoorgani and Latha [6] introduced neighbourly irregular fuzzy graphs and highly irregular fuzzy graphs and a comparative study between them had been analyzed. In the paper, properties between complete fuzzy graph and some operations like Cartesian product, symmetric difference, complement conjunction, disjunction and rejection of fuzzy graphs $G_{1}:\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$ are discussed.

## 2. Preliminaries

A fuzzy subset of a nonempty set $S$ is a mapping $\sigma: S \rightarrow[0,1]$. A fuzzy relation on $S$ is a fuzzy subset of $S \times S$. If $\mu$ and $v$ are fuzzy relations, then $\mu \circ v(u, w)=\operatorname{Sup}\{\mu(u, v) \Lambda v(v, w): v \in S\}$ and

$$
\mu^{k}(u, v)=\operatorname{Sup}\left\{\mu\left(u, u_{1}\right) \Lambda \mu\left(u_{1}, u_{2}\right)\right.
$$

$$
\left.\Lambda \mu\left(u_{2}, u_{3}\right) \Lambda \ldots \Lambda \mu\left(u_{k-1}, v\right): u_{1}, u_{2}, \ldots, u_{k-1} \in S\right\}
$$

where ' $\Lambda$ ' stands for minimum. A fuzzy graph is a pair of functions
$\sigma: V \rightarrow[0,1]$ and $\mu: V \times V \rightarrow[0,1]$, where for all $u, v$ in $V$, we have $\mu(u, v) \leq \sigma(u) \Lambda \sigma(v)$.

Definition 2.1 [4]. The underlying crisp graph of a fuzzy graph $G=$ $(\sigma, \mu)$ is denoted by $G^{*}=\left(\sigma^{*}, \mu^{*}\right)$, where $\sigma^{*}=\{u \in V / \sigma(u)>0\}$ and $\mu^{*}=$ $\{(u, v) \in V \times V / \mu(u, v)>0\}$.

Definition 2.2 [4]. A fuzzy graph $G=(\sigma, \mu)$ is a complete fuzzy graph if $\mu(x, y)=\sigma(x) \wedge \sigma(y)$ for all $x, y \in \sigma^{*}$.

Definition 2.3 [4]. A fuzzy graph $G$ is said to be a strong fuzzy graph if $\mu(x, y)=\sigma(x) \wedge \sigma(y)$ for all $(x, y)$ in $\mu^{*}$.

Definition 2.4 [5]. Let $G=(\sigma, \mu)$ be a fuzzy graph. Then the degree of a vertex $u$ is $d_{G}(u)=d(u)=\sum_{u \neq v} \mu(u, v)=\sum_{(u, v) \in E} \mu(u, v)$.

Definition 2.5 [5]. Let $G=(\sigma, \mu)$ be a fuzzy graph. Then $G$ is irregular, if there is a vertex which is adjacent to vertices with distinct degree.

Definition 2.6 [5]. Let $G=(\sigma, \mu)$ be a connected fuzzy graph. Then $G$ is said to be a neighbourly irregular fuzzy graph if every two adjacent vertices of $G$ have distinct degree.

Definition 2.7 [11]. The complement of a fuzzy graph $G:(\sigma, \mu)$ is a fuzzy graph $\bar{G}:(\bar{\sigma}, \bar{\mu})$, where $\bar{\sigma}=\sigma$ and $\bar{\mu}(u, v)=\sigma(u) \Lambda \sigma(v)-\mu(u, v)$, $\forall u, v \in V$.

Definition 2.8 [6]. An isomorphism of neighbourly irregular fuzzy graphs $h: G \rightarrow G^{\prime}$ is a map $h: V \rightarrow V^{\prime}$ which is bijective that satisfies (i) $\sigma(u)=\sigma^{\prime}(h(u)), \forall u \in V$ and (ii) $\mu(u, v)=\mu^{\prime}(h(u), h(v)), \forall u, v \in V$. It is denoted by $G \cong G^{\prime}$.

Definition 2.9 [5]. Let $G=(\sigma, \mu)$ be a connected fuzzy graph. Then $G$ is said to be a highly irregular fuzzy graph if every vertex of $G$ is adjacent to vertices with distinct degrees.

Definition 2.10 [4]. Let $\sigma_{i}$ be a fuzzy subset of $V_{i}$ and $\mu_{i}$ be a fuzzy subset of $X_{i}, i=1,2$. Define the fuzzy subsets $\sigma_{1} \times \sigma_{2}$ of $V$ and $\mu_{1} \times \mu_{2}$ of $X$ as follows:
(i) $\left(\sigma_{1} \times \sigma_{2}\right)\left(u_{1}, u_{2}\right)=\min \left\{\sigma_{1}\left(u_{1}\right), \sigma_{2}\left(u_{2}\right)\right\}, \forall\left(u_{1}, u_{2}\right) \in V$,
(ii) $\left(\mu_{1} \times \mu_{2}\right)\left(\left(u, u_{2}\right),\left(u, v_{2}\right)\right)=\min \left\{\sigma_{1}(u), \mu_{2}\left(u_{2}, v_{2}\right)\right\}, \forall u \in V_{1}$ and $\left(u_{2}, v_{2}\right) \in X_{2}$,
(iii) $\left(\mu_{1} \times \mu_{2}\right)\left(\left(u_{1}, w\right),\left(v_{1}, w\right)\right)=\min \left\{\sigma_{2}(w), \mu_{1}\left(u_{1}, v_{1}\right)\right\}, \forall w \in V_{2}$ and $\left(u_{1}, v_{1}\right) \in X_{1}$.

Then the fuzzy graph $G=\left(\sigma_{1} \times \sigma_{2}, \mu_{1} \times \mu_{2}\right)$ is said to be the Cartesian product of $G_{1}:\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$.

Definition 2.11 [4]. Let $G_{1}\left[G_{2}\right]$ denote the composition of graph $G_{1}=$ $\left(V_{1}, X_{1}\right)$ with $G_{2}=\left(V_{2}, X_{2}\right)$. Now $G_{1}\left[G_{2}\right]=\left(V_{1} \times V_{2}, X^{0}\right)$, where $X^{0}=$ $X \cup\left\{\left(\left(u_{1}, u_{2}\right),\left(v_{1}, v_{2}\right)\right) /\left(u_{1}, v_{1}\right) \in X_{1}, u_{2} \neq v_{2}\right\}$ and where $X$ is defined as in the case for $G_{1} \times G_{2}$. Let $\sigma_{i}$ be a fuzzy subset of $V_{i}$ and $\mu_{i}$ be a fuzzy subset of $X_{i}, \quad i=1,2$. Define the fuzzy subsets $\sigma_{1} \circ \sigma_{2}$ and $\mu_{1} \circ \mu_{2}$ of $V_{1} \times V_{2}$ and $X^{0}$, respectively, as follows:
(i) $\left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{1}, u_{2}\right)=\min \left\{\sigma_{1}\left(u_{1}\right), \sigma_{2}\left(u_{2}\right)\right\}, \forall\left(u_{1}, u_{2}\right) \in V_{1} \times V_{2}$,
(ii) $\left(\mu_{1} \circ \mu_{2}\right)\left(\left(u, u_{2}\right),\left(u, v_{2}\right)\right)=\min \left\{\sigma_{1}(u), \mu_{2}\left(u_{2}, v_{2}\right)\right\}, \forall u \in V_{1}$ and $\left(u_{2}, v_{2}\right) \in X_{2}$,
(iii) $\left(\mu_{1} \circ \mu_{2}\right)\left(\left(u_{1}, u_{2}\right),\left(v_{1}, v_{2}\right)\right)=\min \left\{\sigma_{2}\left(u_{2}\right), \sigma_{2}\left(v_{2}\right), \mu_{1}\left(u_{1}, v_{1}\right)\right\}$, $\forall\left(\left(u_{1}, u_{2}\right),\left(v_{1}, v_{2}\right)\right) \in X^{0}-X$.

The fuzzy graph $G=\left(\sigma_{1} \circ \sigma_{2}, \mu_{1} \circ \mu_{2}\right)$ is the composition of $G_{1}:\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$.

Definition 2.12 [7]. Let $\sigma_{i}$ be a fuzzy subset of $V_{i}$ and $\mu_{i}$ be a fuzzy
subset of $X_{i}, i=1,2$. Define the fuzzy subsets $\sigma_{1} \wedge \sigma_{2}$ of $V=V_{1} \times V_{2}$ and $\mu_{1} \wedge \mu_{2}$ of $X$ as follows:
(i) $\left(\sigma_{1} \wedge \sigma_{2}\right)\left(u_{1}, v_{1}\right)=\min \left\{\sigma_{1}\left(u_{1}\right), \sigma_{2}\left(v_{1}\right)\right\}, \forall u_{1}, v_{1} \in V$,
(ii) $\left(\mu_{1} \wedge \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=\min \left\{\mu_{1}\left(u_{1}, u_{2}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right\}$, $\forall u_{1}, u_{2} \in V_{1},\left(u_{1}, u_{2}\right) \in X_{1}$ and $v_{1}, v_{2} \in V_{2},\left(v_{1}, v_{2}\right) \in X_{2}$.

Then $G_{1} \wedge G_{2}=\left(\sigma_{1} \wedge \sigma_{2}, \mu_{1} \wedge \mu_{2}\right)$ is said to be the conjunction of $G_{1}$ : $\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$.

Definition 2.13 [7]. Let $\sigma_{i}$ be a fuzzy subset of $V_{i}$ and $\mu_{i}$ be a fuzzy subset of $X_{i}, \quad i=1,2$. Define the fuzzy subsets $\sigma_{1} \mid \sigma_{2}$ of $V=V_{1} \times V_{2}$ and $\mu_{1} \mid \mu_{2}$ of

$$
\begin{aligned}
X= & \left\{\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right) / u_{1} \in V_{1},\left(v_{1}, v_{2}\right) \notin X_{2}\right\} \\
& \cup\left\{\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right) / v_{1} \in V_{2},\left(u_{1}, u_{2}\right) \notin X_{1}\right\} \\
& \cup\left\{\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right) / u_{1}, u_{2} \in V_{1}, u_{1} \neq u_{2}, v_{1}, v_{2} \in V_{2},\right. \\
& \left.v_{1} \neq v_{2},\left(u_{1}, u_{2}\right) \notin X_{1},\left(v_{1}, v_{2}\right) \notin X_{2}\right\}
\end{aligned}
$$

as follows:
(i) $\left(\sigma_{1} \mid \sigma_{2}\right)\left(u_{1}, v_{1}\right)=\min \left\{\sigma_{1}\left(u_{1}\right), \sigma_{2}\left(v_{1}\right)\right\}, \forall u_{1} \in V_{1}, v_{1} \in V_{2}$,
(ii) $\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right)=\min \left\{\sigma_{1}\left(u_{1}\right), \sigma_{2}\left(v_{1}\right), \sigma_{2}\left(v_{2}\right)\right\}, \forall u_{1} \in V_{1}$, $\left(v_{1}, v_{2}\right) \notin X_{2}$,
(iii) $\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right)=\min \left\{\sigma_{2}\left(v_{1}\right), \sigma_{1}\left(u_{1}\right), \sigma_{1}\left(u_{2}\right)\right\}, \quad \forall v_{1} \in V_{2}$, $\left(u_{1}, u_{2}\right) \notin X_{1}$,
(iv) $\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=\min \left\{\sigma_{1}\left(u_{1}\right), \sigma_{1}\left(u_{2}\right), \sigma_{2}\left(v_{1}\right), \sigma_{2}\left(v_{2}\right)\right\}$, $\forall\left(u_{1}, u_{2}\right) \notin X_{1}$ and $\left(v_{1}, v_{2}\right) \notin X_{2}$.

Then $G_{1} \mid G_{2}=\left(\sigma_{1}\left|\sigma_{2}, \mu_{1}\right| \mu_{2}\right)$ is said to be the rejection of $G_{1}:\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$.

Definition 2.14 [7]. Let $\sigma_{i}$ be a fuzzy subset of $V_{i}$ and $\mu_{i}$ be a fuzzy subset of $X_{i}, \quad i=1,2$. Define the fuzzy subsets $\sigma_{1} \oplus \sigma_{2}$ of $V=V_{1} \times V_{2}$ and $\mu_{1} \oplus \mu_{2}$ of

$$
\begin{aligned}
X=\{ & \left.\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right) / u_{1} \in V_{1},\left(v_{1}, v_{2}\right) \in X_{2}\right\} \\
& \cup\left\{\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right) / v_{1} \in V_{2},\left(u_{1}, u_{2}\right) \in X_{1}\right\} \\
& \cup\left\{\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right) / u_{1}, u_{2} \in V_{1}, u_{1} \neq u_{2},\right. \\
& \left.v_{1}, v_{2} \in V_{2}, v_{1} \neq v_{2} \text { either }\left(u_{1}, u_{2}\right) \in X_{1} \text { or }\left(v_{1}, v_{2}\right) \in X_{2}\right\}
\end{aligned}
$$

as follows:
(i) $\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{1}, v_{1}\right)=\min \left\{\sigma_{1}\left(u_{1}\right), \sigma_{2}\left(v_{1}\right)\right\}, \forall u_{1} \in V_{1}, v_{1} \in V_{2}$,
(ii) $\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right)=\min \left\{\sigma_{1}\left(u_{1}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right\}, \forall u_{1} \in V_{1}$, $\left(v_{1}, v_{2}\right) \in X_{2}$,
(iii) $\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right)=\min \left\{\sigma_{2}\left(v_{1}\right), \mu_{1}\left(u_{1}, u_{2}\right)\right\}, \forall v_{1} \in V_{2}$, $\left(u_{1}, u_{2}\right) \in X_{1}$,
(iv) $\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)$

$$
=\left\{\begin{array}{l}
\min \left(\sigma_{1}\left(u_{1}\right), \sigma_{1}\left(u_{2}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right),\left(u_{1}, u_{2}\right) \notin X_{1},\left(v_{1}, v_{2}\right) \in X_{2} \\
\operatorname{\operatorname {min}}\left(\sigma_{2}\left(v_{1}\right), \sigma_{2}\left(v_{2}\right), \mu_{1}\left(u_{1}, u_{2}\right)\right),\left(u_{1}, u_{2}\right) \in X_{1},\left(v_{1}, v_{2}\right) \notin X_{2} .
\end{array}\right.
$$

Then $G_{1} \oplus G_{2}=\left(\sigma_{1} \oplus \sigma_{2}, \mu_{1} \oplus \mu_{2}\right)$ is said to be the symmetric difference of $G_{1}:\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$.

## 3. Properties on Some Operations of Fuzzy Graphs

Theorem 3.1. If $G_{1}:\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$ are strong fuzzy graphs, then $G_{1} \wedge G_{2}$ is also a strong fuzzy graph.

Proof. If $\forall u_{1}, u_{2} \in V_{1},\left(u_{1}, u_{2}\right) \in X_{1}$ and $v_{1}, v_{2} \in V_{2},\left(v_{1}, v_{2}\right) \in X_{2}$, then

$$
\begin{aligned}
\left(\mu_{1} \wedge \mu_{2}\right)\left(\left(u_{1}, v_{1}\right)\left(u_{2}, v_{2}\right)\right)= & \min \left\{\mu_{1}\left(u_{1}, u_{2}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right\} \\
= & \min \left\{\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right), \sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right\} \\
& \text { since } G_{1} \text { and } G_{2} \text { are strong fuzzy graphs } \\
= & \min \left\{\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right), \sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{2}\right)\right\} \\
= & \min \left\{\left(\sigma_{1} \wedge \sigma_{2}\right)\left(u_{1}, v_{1}\right),\left(\sigma_{1} \wedge \sigma_{2}\right)\left(u_{2}, v_{2}\right)\right\} .
\end{aligned}
$$

Suppose $\left(u_{1}, u_{2}\right) \notin X_{1}$ and $\left(v_{1}, v_{2}\right) \in X_{2}$ (or) $\left(u_{1}, u_{2}\right) \in X_{1}$ and $\left(v_{1}, v_{2}\right)$ $\notin X_{2}$. Then in both cases, $\left(\mu_{1} \wedge \mu_{2}\right)\left(\left(u_{1}, v_{1}\right)\left(u_{2}, v_{2}\right)\right)=0$. Thus, $G_{1} \wedge G_{2}$ is a strong fuzzy graph.

In the following example, it is shown that if $G_{1}$ and $G_{2}$ are not strong fuzzy graphs, then $G_{1} \wedge G_{2}$ is not a strong fuzzy graph.

## Example 3.2.

Theorem 3.3. If $G_{1}:\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$ are complete fuzzy graphs, then $G_{1} \oplus G_{2}$ is a strong fuzzy graph.

Proof. Let $G_{1} \oplus G_{2}=G=(\sigma, \mu)$, where $\sigma=\sigma_{1} \oplus \sigma_{2}$ and $\mu=$ $\mu_{1} \oplus \mu_{2}$ and $G^{*}:(V, X)$, where $V=V_{1} \times V_{2}$ and

$$
\begin{aligned}
X=\{ & \left.\left\{\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right) / u_{1} \in V_{1},\left(v_{1}, v_{2}\right) \in X_{2}\right\} \\
& \cup\left\{\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right) / v_{1} \in V_{2},\left(u_{1}, u_{2}\right) \in X_{1}\right\} \\
& \cup\left\{\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right) / u_{1}, u_{2} \in V_{1}, u_{1} \neq u_{2},\right. \\
& \left.v_{1}, v_{2} \in V_{2}, v_{1} \neq v_{2} \text { either }\left(u_{1}, u_{2}\right) \in X_{1} \text { or }\left(v_{1}, v_{2}\right) \in X_{2}\right\} .
\end{aligned}
$$

Case (i) Let $e=\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right), \forall u_{1} \in V_{1}, \quad\left(v_{1}, v_{2}\right) \in X_{2}$. Then
$\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right)=\min \left\{\sigma_{1}\left(u_{1}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right\}$

$$
=\sigma_{1}\left(u_{1}\right) \wedge\left[\sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right]
$$

since $G_{2}$ is a complete fuzzy graph

$$
=\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right] \wedge\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right]
$$

$$
=\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{1}, v_{1}\right) \wedge\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{1}, v_{2}\right) .
$$

Case (ii) Let $e=\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right), \forall v_{1} \in V_{2},\left(u_{1}, u_{2}\right) \in X_{1}$. Then $\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right)=\min \left\{\sigma_{2}\left(v_{1}\right), \mu_{1}\left(u_{1}, u_{2}\right)\right\}$

$$
=\sigma_{2}\left(v_{1}\right) \wedge\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right)\right],
$$

since $G_{1}$ is a complete fuzzy graph
$=\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right] \wedge\left[\sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{1}\right)\right]$
$=\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{1}, v_{1}\right) \wedge\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{2}, v_{1}\right)$.
Case (iii) Let $e=\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right), \forall u_{1}, u_{2} \in V_{1}, v_{1}, v_{2} \in V_{2}$.
(a) Suppose $\left(u_{1}, u_{2}\right) \notin X_{1}$ and $\left(v_{1}, v_{2}\right) \in X_{2}$. Then

$$
\begin{aligned}
\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)= & \min \left(\sigma_{1}\left(u_{1}\right), \sigma_{1}\left(u_{2}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right) \\
= & \sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right) \wedge\left\{\sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right\} \\
& \text { since } G_{2} \text { is a complete fuzzy graph } \\
= & \left\{\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right\} \wedge\left\{\sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{2}\right)\right\} \\
= & \left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{1}, v_{1}\right) \wedge\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{2}, v_{2}\right)
\end{aligned}
$$

(b) Suppose $\left(u_{1}, u_{2}\right) \in X_{1},\left(v_{1}, v_{2}\right) \notin X_{2}$. Then

$$
\begin{aligned}
\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right) & =\min \left(\sigma_{2}\left(v_{1}\right), \sigma_{2}\left(v_{2}\right), \mu_{1}\left(u_{1}, u_{2}\right)\right) \\
& =\sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right) \wedge\left\{\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right)\right\}
\end{aligned}
$$

$$
\text { since } G_{1} \text { is a complete fuzzy graph }
$$

$$
=\left\{\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right\} \wedge\left\{\sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{2}\right)\right\}
$$

$$
=\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{1}, v_{1}\right) \wedge\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{2}, v_{2}\right)
$$

Thus, in all cases, it is true that $G_{1} \oplus G_{2}$ is a strong fuzzy graph.
Example 3.4. This example illustrates that if $G_{1}$ and $G_{2}$ are not complete fuzzy graphs, then $G_{1} \oplus G_{2}$ is not a strong fuzzy graph.

Theorem 3.5. If $G_{1}:\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$ are complete fuzzy graphs, then $G_{1} \circ G_{2}$ is also a complete fuzzy graph.

Proof. Let $G_{1} \circ G_{2}=G=(\sigma, \mu)$, where $\sigma=\sigma_{1} \circ \sigma_{2}$ and $\mu=\mu_{1} \circ \mu_{2}$ and $G^{*}:(V, X)$, where $V=V_{1} \times V_{2}$ and

$$
\begin{aligned}
X= & \left\{\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right) / u_{1} \in V_{1},\left(v_{1}, v_{2}\right) \in X\right\} \\
& \cup\left\{\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right) / v_{1} \in V_{2},\left(u_{1}, u_{2}\right) \in X_{1}\right\} \\
& \cup\left\{\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right) /\left(u_{1}, u_{2}\right) \in X_{1}, v_{1} \neq v_{2}\right\} .
\end{aligned}
$$

## Case (i)

$$
\begin{aligned}
\left(\mu_{1} \circ \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right)= & \min \left\{\sigma_{1}\left(u_{1}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right\} \\
= & \sigma_{1}\left(u_{1}\right) \wedge\left[\sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right], \\
& \text { since } G_{2} \text { is complete } \\
= & {\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right] \wedge\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right] } \\
= & \left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{1}, v_{1}\right) \wedge\left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{1}, v_{2}\right) .
\end{aligned}
$$

## Case (ii)

$$
\begin{aligned}
\left(\mu_{1} \circ \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right)= & \min \left\{\sigma_{2}\left(v_{1}\right), \mu_{1}\left(u_{1}, u_{2}\right)\right\} \\
= & \sigma_{2}\left(v_{1}\right) \wedge\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right)\right], \\
& \text { since } G_{1} \text { is complete } \\
= & {\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right] \wedge\left[\sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{1}\right)\right] } \\
= & \left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{1}, v_{1}\right) \wedge\left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{2}, v_{1}\right) .
\end{aligned}
$$

## Case (iii)

$$
\begin{aligned}
\left(\mu_{1} \circ \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)= & \min \left(\sigma_{2}\left(v_{1}\right), \sigma_{2}\left(v_{2}\right), \mu_{1}\left(u_{1}, u_{2}\right)\right) \\
= & \left\{\sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right\} \wedge\left\{\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right)\right\}, \\
& \text { since } G_{1} \text { is complete }
\end{aligned}
$$

$$
\begin{aligned}
& =\left\{\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right\} \wedge\left\{\sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{2}\right)\right\} \\
& =\left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{1}, v_{1}\right) \wedge\left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{2}, v_{2}\right) .
\end{aligned}
$$

Thus, it is clear that $G_{1} \circ G_{2}$ is a complete fuzzy graph.
Theorem 3.6. If $G_{1}:\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$ are complete fuzzy graphs, then $\overline{G_{1} \circ G_{2}} \cong \overline{G_{1}} \circ \overline{G_{2}}$.

Proof. Let $G_{1} \circ G_{2}=G=(\sigma, \mu)$, where $\sigma=\sigma_{1} \circ \sigma_{2}$ and $\mu=\mu_{1} \circ \mu_{2}$ and $G^{*}:(V, X)$, where $V=V_{1} \times V_{2}$ and

$$
\begin{aligned}
X=\{ & \left.\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right) / u_{1} \in V_{1},\left(v_{1}, v_{2}\right) \in X_{2}\right\} \\
& \cup\left\{\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right) / v_{1} \in V_{2},\left(u_{1}, u_{2}\right) \in X_{1}\right\} \\
& \cup\left\{\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right) /\left(u_{1}, u_{2}\right) \in X_{1}, v_{1} \neq v_{2}\right\} .
\end{aligned}
$$

To prove $\left(\overline{\sigma_{1} \circ \sigma_{2}}\right)\left(u_{1} v_{1}\right)=\left(\overline{\sigma_{1}} \circ \overline{\sigma_{2}}\right)\left(u_{1} v_{1}\right)$,

$$
\begin{aligned}
\left(\overline{\sigma_{1} \circ \sigma_{2}}\right)\left(u_{1} v_{1}\right) & =\left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{1} v_{1}\right), \text { by definition of complement } \\
& =\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right) \\
& =\overline{\sigma_{1}}\left(u_{1}\right) \wedge \overline{\sigma_{2}}\left(v_{1}\right) \\
& =\left(\overline{\sigma_{1}} \circ \overline{\sigma_{2}}\right)\left(u_{1} v_{1}\right) .
\end{aligned}
$$

Now to prove $\overline{G_{1} \circ G_{2}}=\overline{G_{1}} \circ \overline{G_{2}}$ for all edges $X$, obtained by joining the vertices of $V_{1}$ and $V_{2}$.

Case (i) If for all $u_{1} \in V_{1},\left(v_{1}, v_{2}\right) \in X_{2}$, then

$$
\left(\mu_{1} \circ \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right)=\min \left\{\sigma_{1}\left(u_{1}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right\} .
$$

Therefore,

$$
\begin{aligned}
& \left(\overline{\mu_{1} \circ \mu_{2}}\right)\left(\left(u_{1} v_{1}\right),\left(u_{1} v_{2}\right)\right) \\
& \quad=\left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{1} v_{1}\right) \wedge\left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{1} v_{2}\right)-\left(\mu_{1} \circ \mu_{2}\right)\left(\left(u_{1} v_{1}\right),\left(u_{1} v_{2}\right)\right)
\end{aligned}
$$

$$
\begin{aligned}
& \quad=\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right] \wedge\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right]-\left[\sigma_{1}\left(u_{1}\right) \wedge \mu_{2}\left(v_{1}, v_{2}\right)\right] \\
& =\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right]-\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right] \\
& \quad=0, \\
& \left(\overline{\mu_{1}} \circ \overline{\mu_{2}}\right)\left(\left(u_{1} v_{1}\right),\left(u_{1} v_{2}\right)\right) \\
& \quad=\overline{\sigma_{1}}\left(u_{1}\right) \wedge \overline{\mu_{2}}\left(v_{1}, v_{2}\right)=0, \text { since } G_{2} \text { is complete. }
\end{aligned}
$$

Case (ii) If for all $v_{1} \in V_{2},\left(u_{1}, u_{2}\right) \in X_{1}$, then $\left(\mu_{1} \circ \mu_{2}\right)\left(\left(u_{1}, v_{1}\right)\right.$, $\left.\left(u_{2}, v_{1}\right)\right)=\min \left\{\sigma_{2}\left(v_{1}\right), \mu_{1}\left(u_{1}, u_{2}\right)\right\}$,

$$
\begin{aligned}
\left(\overline{\mu_{1} \circ} \mu_{2}\right. & \left(\left(u_{1} v_{1}\right),\left(u_{2} v_{1}\right)\right) \\
& =\left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{1} v_{1}\right) \wedge\left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{2} v_{1}\right)-\left(\mu_{1} \circ \mu_{2}\right)\left(\left(u_{1} v_{1}\right),\left(u_{2} v_{1}\right)\right) \\
& =\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right] \wedge\left[\sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{1}\right)\right]-\left[\sigma_{2}\left(v_{1}\right) \wedge \mu_{1}\left(u_{1}, u_{2}\right)\right] \\
& =\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{1}\right)\right]-\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{1}\right)\right],
\end{aligned}
$$

$$
\text { since } G_{1} \text { is complete }
$$

$$
=0
$$

$$
\left(\overline{\mu_{1}} \circ \overline{\mu_{2}}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right)
$$

$$
=\overline{\sigma_{2}}\left(v_{1}\right) \wedge \overline{\mu_{1}}\left(u_{1}, u_{2}\right)=0, \text { since } G_{1} \text { is complete. }
$$

Case (iii) If for all $\left(u_{1}, u_{2}\right) \in X_{1}, v_{1} \neq v_{2}$, then $\left(\mu_{1} \circ \mu_{2}\right)\left(\left(u_{1} v_{1}\right)\right.$, $\left.\left(u_{2} v_{2}\right)\right)=\min \left\{\sigma_{2}\left(v_{1}\right), \sigma_{2}\left(v_{2}\right), \mu_{1}\left(u_{1} u_{2}\right)\right\}$,

$$
\begin{aligned}
\left(\overline{\mu_{1} \circ} \mu_{2}\right. & \left(\left(u_{1} v_{1}\right),\left(u_{2} v_{2}\right)\right) \\
= & \left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{1} v_{1}\right) \wedge\left(\sigma_{1} \circ \sigma_{2}\right)\left(u_{2} v_{2}\right)-\left(\mu_{1} \circ \mu_{2}\right)\left(\left(u_{1} v_{1}\right),\left(u_{2} v_{2}\right)\right) \\
= & \left\{\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right\} \wedge\left\{\sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{2}\right)\right\} \\
& -\left\{\sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right) \wedge \sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right)\right\}, \text { since } G_{1} \text { is complete } \\
= & 0
\end{aligned}
$$

$$
\begin{aligned}
& \left(\overline{\mu_{1}} \circ \overline{\mu_{2}}\right)\left(\left(u_{1} v_{1}\right),\left(u_{2} v_{2}\right)\right) \\
& \quad=\overline{\sigma_{2}}\left(v_{1}\right) \wedge \overline{\sigma_{2}}\left(v_{2}\right) \wedge \overline{\mu_{1}}\left(u_{1}, u_{2}\right)=0, \text { since } G_{1} \text { is complete. }
\end{aligned}
$$

Thus, in all cases, it follows that $\overline{G_{1} \circ G_{2}} \cong \overline{G_{1}} \circ \overline{G_{2}}$.
In the above discussion of all the cases, it is clear that the vertices in $\overline{G_{1} \circ G_{2}}$ and $\overline{G_{1}} \circ \overline{G_{2}}$ are isolated. This implies that no two vertices are adjacent. Therefore, they are neighbourly irregular fuzzy graphs.

Theorem 3.7. If $G_{1}:\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$ are complete fuzzy graphs, then $\overline{G_{1} \mid G_{2}} \cong \overline{G_{1}} \mid \overline{G_{2}}$.

Proof. Let $G_{1} \mid G_{2}=(\sigma, \mu)$, where $\sigma=\sigma_{1}\left|\sigma_{2}, \mu=\mu_{1}\right| \mu_{2}, G^{*}:(V, X)$, where $V=V_{1} \times V_{2}$,

$$
\begin{aligned}
X=\{ & \left\{\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right) / u_{1} \in V_{1},\left(v_{1}, v_{2}\right) \notin X_{2}\right\} \\
& \bigcup\left\{\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right) / v_{1} \in V_{2},\left(u_{1}, u_{2}\right) \notin X_{1}\right\} \\
& \bigcup\left\{\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right) / u_{1}, u_{2} \in V_{1}, u_{1} \neq u_{2},\right. \\
& \left.v_{1}, v_{2} \in V_{2}, v_{1} \neq v_{2},\left(u_{1}, u_{2}\right) \notin X_{1},\left(v_{1}, v_{2}\right) \notin X_{2}\right\} .
\end{aligned}
$$

To prove $\left(\overline{\sigma_{1} \mid \sigma_{2}}\right)\left(u_{1} v_{1}\right)=\left(\overline{\sigma_{1}} \mid \overline{\sigma_{2}}\right)\left(u_{1} v_{1}\right)$,

$$
\begin{aligned}
\left(\overline{\sigma_{1} \mid \sigma_{2}}\right)\left(u_{1} v_{1}\right) & =\left(\sigma_{1} \mid \sigma_{2}\right)\left(u_{1} v_{1}\right), \text { by definition of complement } \\
& =\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right) \\
& =\overline{\sigma_{1}}\left(u_{1}\right) \wedge \overline{\sigma_{2}}\left(v_{1}\right) \\
& =\left(\overline{\sigma_{1}} \mid \overline{\sigma_{2}}\right)\left(u_{1} v_{1}\right)
\end{aligned}
$$

Now to prove $\overline{G_{1} \mid G_{2}}=\overline{G_{1}} \mid \overline{G_{2}}$ for all edges $X$, obtained by joining the vertices of $V_{1}$ and $V_{2}$.

Case (i) By definition, $\forall u_{1} \in V_{1},\left(v_{1}, v_{2}\right) \notin X_{2}$,

$$
\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right)=\min \left\{\sigma_{1}\left(u_{1}\right), \sigma_{2}\left(v_{1}\right), \sigma_{2}\left(v_{2}\right)\right\} .
$$

Since $G_{2}$ is complete, $\left(v_{1}, v_{2}\right) \in X_{2}$. Therefore, $\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right)$ $=0$.

Hence,

$$
\begin{aligned}
\left(\overline{\mu_{1} \mid \mu_{2}}\right) & \left(\left(u_{1} v_{1}\right),\left(u_{1} v_{2}\right)\right) \\
& =\left(\sigma_{1} \mid \sigma_{2}\right)\left(u_{1} v_{1}\right) \wedge\left(\sigma_{1} \mid \sigma_{2}\right)\left(u_{1} v_{2}\right)-\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1} v_{1}\right),\left(u_{1} v_{2}\right)\right) \\
& =\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right] \wedge\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right]-0 \\
& =\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right]
\end{aligned}
$$

$$
\left(\overline{\mu_{1}} \mid \overline{\mu_{2}}\right)\left(\left(u_{1} v_{1}\right),\left(u_{1} v_{2}\right)\right)
$$

$$
=\overline{\sigma_{1}}\left(u_{1}\right) \wedge \overline{\sigma_{2}}\left(v_{1}\right) \wedge \overline{\sigma_{2}}\left(v_{2}\right)=\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)
$$ since $G_{2}$ is complete.

Case (ii) By definition, $\forall v_{1} \in V_{2},\left(u_{1}, u_{2}\right) \notin X_{1}$,

$$
\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1} v_{1}\right),\left(u_{2} v_{1}\right)\right)=\min \left\{\sigma_{1}\left(u_{1}\right), \sigma_{1}\left(u_{2}\right), \sigma_{2}\left(v_{1}\right)\right\}
$$

Since $G_{1}$ is complete, $\left(u_{1}, u_{2}\right) \in X_{1}$. Therefore, $\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1} v_{1}\right),\left(u_{2} v_{1}\right)\right)=0$.
Hence,

$$
\begin{aligned}
&\left(\overline{\mu_{1} \mid \mu_{2}}\right)\left(\left(u_{1} v_{1}\right),\left(u_{2} v_{1}\right)\right) \\
&=\left(\sigma_{1} \mid \sigma_{2}\right)\left(u_{1} v_{1}\right) \wedge\left(\sigma_{1} \mid \sigma_{2}\right)\left(u_{2} v_{1}\right)-\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1} v_{1}\right),\left(u_{2} v_{1}\right)\right) \\
&= {\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right] \wedge\left[\sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{1}\right)\right]-0 } \\
&= {\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{1}\right)\right] } \\
&\left(\overline{\mu_{1}} \mid \overline{\mu_{2}}\right)\left(\left(u_{1} v_{1}\right),\left(u_{2} v_{1}\right)\right) \\
&= \overline{\sigma_{1}}\left(u_{1}\right) \wedge \overline{\sigma_{1}}\left(u_{2}\right) \wedge \overline{\sigma_{2}}\left(v_{1}\right)=\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{1}\right), \\
& \quad \text { since } G_{1} \text { is complete. }
\end{aligned}
$$

Case (iii) By definition, $\forall\left(u_{1}, u_{2}\right) \notin X_{1}$ and $\left(v_{1}, v_{2}\right) \notin X_{2}$,

$$
\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=\min \left\{\sigma_{1}\left(u_{1}\right), \sigma_{1}\left(u_{2}\right), \sigma_{2}\left(v_{1}\right), \sigma_{2}\left(v_{2}\right)\right\} .
$$

Since $G_{1}$ and $G_{2}$ are complete, $\forall u_{1}, u_{2} \in V_{1},\left(u_{1}, u_{2}\right) \in X_{1}$ and $v_{1}, v_{2}$ $\in V_{2},\left(v_{1}, v_{2}\right) \in X_{2}$. Therefore, $\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=0$.

Hence,

$$
\begin{aligned}
& \left(\overline{\mu_{1} \mid} \mid \overline{\mu_{2}}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right) \\
& \quad=\left(\sigma_{1} \mid \sigma_{2}\right)\left(u_{1} v_{1}\right) \wedge\left(\sigma_{1} \mid \sigma_{2}\right)\left(u_{2} v_{2}\right)-\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1} v_{1}\right),\left(u_{2} v_{1}\right)\right) \\
& \quad=\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right] \wedge\left[\sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{2}\right)\right]-0 \\
& \quad=\left[\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right], \\
& \left(\overline{\mu_{1}} \mid \overline{\mu_{2}}\right)\left(\left(u_{1} v_{1}\right),\left(u_{2} v_{2}\right)\right) \\
& \quad=\overline{\sigma_{1}}\left(u_{1}\right) \wedge \overline{\sigma_{1}}\left(u_{2}\right) \wedge \overline{\sigma_{2}}\left(v_{1}\right) \wedge \overline{\sigma_{2}}\left(v_{2}\right) \\
& \quad=\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right), \text { since } G_{1} \text { and } G_{2} \text { are complete. }
\end{aligned}
$$

Thus, for all the cases, it follows that $\overline{G_{1} \mid G_{2}} \cong \overline{G_{1}} \mid \overline{G_{2}}$.
In general, $\overline{G_{1} \mid G_{2}} \neq \overline{G_{1}} \mid \overline{G_{2}}$. This is shown in the following example where $G_{1}$ or $G_{2}$ is not complete.

## Example 3.8.

Theorem 3.9. If $G_{1}:\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$ are complete fuzzy graphs, then $\overline{G_{1}} \oplus \overline{G_{2}} \cong G_{1} \mid G_{2}$.

Proof. Let $G_{1} \oplus G_{2}=(\sigma, \mu)$, where $\sigma=\sigma_{1} \oplus \sigma_{2}, \mu=\mu_{1} \oplus \mu_{2}$ and $G^{*}:(V, X)$, where $V=V_{1} \times V_{2}$ and

$$
\begin{aligned}
X=\{ & \left\{\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right) / u_{1} \in V_{1},\left(v_{1}, v_{2}\right) \in X_{2}\right\} \\
& \cup\left\{\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right) / v_{1} \in V_{2},\left(u_{1}, u_{2}\right) \in X_{1}\right\} \\
& \cup\left\{\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right) / u_{1}, u_{2} \in V_{1}, u_{1} \neq u_{2}, v_{1}, v_{2} \in V_{2},\right. \\
& \left.v_{1} \neq v_{2} \text { either }\left(u_{1}, u_{2}\right) \in X_{1} \text { or }\left(v_{1}, v_{2}\right) \in X_{2}\right\} .
\end{aligned}
$$

Since $G_{1}$ and $G_{2}$ are complete fuzzy graphs,
$\overline{\mu_{1}}\left(u_{1}, u_{2}\right)=0, \forall\left(u_{1}, u_{2}\right)=X_{1}$ and $\overline{\mu_{2}}\left(v_{1}, v_{2}\right)=0, \forall\left(v_{1}, v_{2}\right)=X_{2}$.
To prove $\left(\overline{\sigma_{1}} \oplus \overline{\sigma_{2}}\right)\left(u_{1} v_{1}\right)=\left(\sigma_{1} \mid \sigma_{2}\right)\left(u_{1} v_{1}\right)$,

$$
\begin{aligned}
\left(\overline{\sigma_{1}} \oplus \overline{\sigma_{2}}\right)\left(u_{1} v_{1}\right) & =\overline{\sigma_{1}}\left(u_{1}\right) \wedge \overline{\sigma_{2}}\left(v_{1}\right) \\
& =\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right), \text { by definition of complement } \\
& =\left(\sigma_{1} \mid \sigma_{2}\right)\left(u_{1} v_{1}\right) .
\end{aligned}
$$

Now to prove $\overline{G_{1}} \oplus \overline{G_{2}}=G_{1} \mid G_{2}$ for all edges joining the vertices of $V_{1}$ and $V_{2}$.

## Case (i)

$$
\begin{aligned}
\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right)= & \min \left\{\sigma_{1}\left(u_{1}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right\}, \\
& \forall u_{1} \in V_{1},\left(v_{1}, v_{2}\right) \in X_{2}
\end{aligned}
$$

Therefore, $\left(\overline{\mu_{1}} \oplus \overline{\mu_{2}}\right)\left(\left(u_{1} v_{1}\right),\left(u_{1} v_{2}\right)\right)=\overline{\sigma_{1}}\left(u_{1}\right) \wedge \overline{\mu_{2}}\left(v_{1}, v_{2}\right)=0$, since $G_{2}$ is complete and $\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right)=0$, since $\left(v_{1}, v_{2}\right) \in X_{2}$.

## Case (ii)

$$
\begin{aligned}
\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right)= & \min \left\{\sigma_{2}\left(v_{1}\right), \mu_{1}\left(u_{1}, u_{2}\right)\right\}, \\
& \forall v_{1} \in V_{2},\left(u_{1}, u_{2}\right) \in X_{1} .
\end{aligned}
$$

Therefore, $\left(\overline{\mu_{1}} \oplus \overline{\mu_{2}}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right)=\overline{\sigma_{2}}\left(v_{1}\right) \wedge \overline{\mu_{1}}\left(u_{1}, u_{2}\right)=0$, since $G_{1}$ is complete and $\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right)=0$, since $\left(u_{1}, u_{2}\right) \in X_{1}$.

Case (iii) If $\left(u_{1}, u_{2}\right) \notin X_{1},\left(v_{1}, v_{2}\right) \in X_{2}$, then

$$
\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=\min \left(\sigma_{1}\left(u_{1}\right), \sigma_{1}\left(u_{2}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right) .
$$

Therefore, $\left(\overline{\mu_{1}} \oplus \overline{\mu_{2}}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=\overline{\sigma_{1}}\left(u_{1}\right) \wedge \overline{\sigma_{2}}\left(v_{1}\right) \wedge \overline{\mu_{2}}\left(v_{1}, v_{2}\right)=0$ and $\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=0$, since $\left(v_{1}, v_{2}\right) \in X_{2}$.

Case (iv) If $\left(u_{1}, u_{2}\right) \in X_{1},\left(v_{1}, v_{2}\right) \notin X_{2}$, then

$$
\begin{aligned}
& \left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=\min \left(\sigma_{2}\left(v_{1}\right), \sigma_{2}\left(v_{2}\right), \mu_{1}\left(u_{1}, u_{2}\right)\right), \\
& \left(\overline{\mu_{1}} \oplus \overline{\mu_{2}}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=\overline{\sigma_{2}}\left(v_{1}\right), \overline{\sigma_{2}}\left(v_{2}\right) \wedge \overline{\mu_{1}}\left(u_{1}, u_{2}\right)=0
\end{aligned}
$$

and

$$
\left(\mu_{1} \mid \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=0, \text { since }\left(u_{1}, u_{2}\right) \in X_{1}
$$

Thus, in all cases, it follows that $\overline{G_{1}} \oplus \overline{G_{2}} \cong G_{1} \mid G_{2}$.
In the discussion of the above theorem, it is clear that the vertices in $\overline{G_{1}} \oplus \overline{G_{2}}$ and $G_{1} \mid G_{2}$ are isolated. Therefore, they are neighbourly irregular fuzzy graphs as no two vertices are adjacent.

In general, $\overline{G_{1}} \oplus \overline{G_{2}} \neq G_{1} \mid G_{2}$. This is illustrated in the following example:

## Example 3.10.

$\overline{\mathbf{G}}_{1} \oplus \overline{\mathbf{G}}_{2}:\left(\sigma_{1} \oplus \sigma_{2}, \bar{\mu}_{1} \oplus \bar{\mu}_{2}\right)$
Theorem 3.11. If $G_{1}:\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$ are complete fuzzy graphs, then $G_{1} \oplus G_{2} \cong G_{1} \times G_{2}$.

Proof. To prove $\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{1} v_{1}\right)=\left(\sigma_{1} \times \sigma_{2}\right)\left(u_{1} v_{1}\right)$,

$$
\begin{aligned}
\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{1} v_{1}\right) & =\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right), \forall u_{1} \in V_{1}, v_{1} \in V_{2} \\
& =\left(\sigma_{1} \times \sigma_{2}\right)\left(u_{1} v_{1}\right) .
\end{aligned}
$$

Now, for all edges $(e)$, obtained by joining the vertices of $V_{1}$ and $V_{2}$, it suffices to prove that $\left(\mu_{1} \oplus \mu_{2}\right)(e)=\left(\mu_{1} \times \mu_{2}\right)(e)$.

Case (i) If for all $u_{1} \in V_{1},\left(v_{1}, v_{2}\right) \in X_{2}$, then

$$
\begin{aligned}
\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right) & =\min \left\{\sigma_{1}\left(u_{1}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right\} \\
& =\left(\mu_{1} \times \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right) .
\end{aligned}
$$

Case (ii) If for all $v_{1} \in V_{2},\left(u_{1}, u_{2}\right) \in X_{1}$, then

$$
\begin{aligned}
\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right) & =\min \left\{\sigma_{2}\left(v_{1}\right), \mu_{1}\left(u_{1}, u_{2}\right)\right\} \\
& =\left(\mu_{1} \times \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right) .
\end{aligned}
$$

Case (iii) Now consider the edge $e=\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right), u_{1}, u_{2} \in V_{1}$, $u_{1} \neq u_{2}, \quad v_{1}, v_{2} \in V_{2}, \quad v_{1} \neq v_{2}$.
(a) If $\left(u_{1}, u_{2}\right) \notin X_{1},\left(v_{1}, v_{2}\right) \in X_{2}$, then

$$
\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=\min \left(\sigma_{1}\left(u_{1}\right), \sigma_{1}\left(u_{2}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right)=0,
$$

since $\left(u_{1}, u_{2}\right) \in X_{1}$ as $G_{1}$ is complete.
(b) If $\left(u_{1}, u_{2}\right) \in X_{1},\left(v_{1}, v_{2}\right) \notin X_{2}$, then
$\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=\min \left(\sigma_{2}\left(v_{1}\right), \sigma_{2}\left(v_{2}\right), \mu_{1}\left(u_{1}, u_{2}\right)\right)=0$,
since $\left(v_{1}, v_{2}\right) \in X_{2}$ as $G_{2}$ is complete.
Thus, by all means, $G_{1} \oplus G_{2} \cong G_{1} \times G_{2}$.
$G_{1} \oplus G_{2} \cong G_{1} \times G_{2}$ is not true always. This is shown in the following example:

## Example 3.12.

Theorem 3.13. If $G_{1}:\left(\sigma_{1}, \mu_{1}\right)$ and $G_{2}:\left(\sigma_{2}, \mu_{2}\right)$ are complete fuzzy graphs, then $\overline{G_{1} \oplus G_{2}} \cong G_{1} \wedge G_{2}$.

Proof. To prove $\left(\overline{\sigma_{1} \oplus \sigma_{2}}\right)\left(u_{1} v_{1}\right)=\left(\sigma_{1} \wedge \sigma_{2}\right)\left(u_{1} v_{1}\right)$,

$$
\left(\overline{\sigma_{1} \oplus \sigma_{2}}\right)\left(u_{1} v_{1}\right)=\overline{\sigma_{1}}\left(u_{1}\right) \wedge \overline{\sigma_{2}}\left(v_{1}\right)=\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)=\left(\sigma_{1} \wedge \sigma_{2}\right)\left(u_{1} v_{1}\right) .
$$

Now to prove $\left(\overline{\mu_{1} \oplus \mu_{2}}\right)(e)=\left(\mu_{1} \wedge \mu_{2}\right)(e)$, for all edges $(e)$, obtained by joining the vertices of $V_{1}$ and $V_{2}$.

Case (i) If $\forall u_{1} \in V_{1},\left(v_{1}, v_{2}\right) \in X_{2}$, then
$\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)$
$=\min \left\{\sigma_{1}\left(u_{1}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right\}$,
$\left(\overline{\mu_{1} \oplus \mu_{2}}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right)$
$=\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{1}, v_{1}\right) \wedge\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{1}, v_{2}\right)$
$-\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right)$
$=\left(\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right) \wedge\left(\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right)-\left(\sigma_{1}\left(u_{1}\right) \wedge \mu_{2}\left(v_{1}, v_{2}\right)\right)$
$=\left(\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right)-\left(\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right)$
$=0$, since $G_{2}$ is a complete fuzzy graph .
$\left(\mu_{1} \wedge \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{1}, v_{2}\right)\right)=0$, by definition of operation 'conjunction'.
Case (ii) If $\forall v_{1} \in V_{2},\left(u_{1}, u_{2}\right) \in X_{1}$, then

$$
\begin{aligned}
& \left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right) \\
& \quad=\min \left\{\sigma_{2}\left(v_{1}\right), \mu_{1}\left(u_{1}, u_{2}\right)\right\}, \\
& \left(\overline{\mu_{1} \oplus} \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right) \\
& \quad=\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{1}, v_{1}\right) \wedge\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{2}, v_{1}\right) \\
& \quad-\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right)
\end{aligned}
$$

$$
\begin{aligned}
= & \left(\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right) \wedge\left(\sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{1}\right)\right)-\left(\sigma_{2}\left(v_{1}\right) \wedge \mu_{1}\left(u_{1}, u_{2}\right)\right) \\
= & \left(\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{1}\right)\right)-\left(\sigma_{2}\left(v_{1}\right) \wedge \sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right)\right) \\
& \left(\text { as } G_{1} \text { is complete }\right) \\
= & 0
\end{aligned}
$$

$\left(\mu_{1} \wedge \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{1}\right)\right)=0$, by definition of operation 'conjunction'.
Case (iii) (a) Suppose $\left(u_{1}, u_{2}\right) \notin X_{1},\left(v_{1}, v_{2}\right) \in X_{2}$. Then
$\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=\min \left(\sigma_{1}\left(u_{1}\right), \sigma_{1}\left(u_{2}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right)$, $\left(\overline{\mu_{1} \oplus \mu_{2}}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{1}, v_{1}\right) \wedge\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{2}, v_{2}\right)$

$$
-\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)
$$

$$
=\left(\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right) \wedge\left(\sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{2}\right)\right)-0
$$

since $\left(u_{1}, u_{2}\right) \in X_{1}$ as $G_{1}$ is complete

$$
=\left(\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right) \wedge \sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{2}\right)\right)
$$

$$
\left(\mu_{1} \wedge \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)
$$

$$
=\min \left\{\mu_{1}\left(u_{1}, u_{2}\right), \mu_{2}\left(v_{1}, v_{2}\right)\right\}
$$

$$
=\min \left\{\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right), \sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)\right\}
$$

since $G_{1}$ and $G_{2}$ are complete

$$
=\sigma_{1}\left(u_{1}\right) \wedge \sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{1}\right) \wedge \sigma_{2}\left(v_{2}\right)
$$

(b) Suppose $\left(u_{1}, u_{2}\right) \in X_{1},\left(v_{1}, v_{2}\right) \notin X_{2}$. Then

$$
\begin{aligned}
\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)= & \min \left(\sigma_{2}\left(v_{1}\right), \sigma_{2}\left(v_{2}\right), \mu_{1}\left(u_{1}, u_{2}\right)\right) \\
\left(\overline{\mu_{1} \oplus \mu_{2}}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)= & \left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{1}, v_{1}\right) \wedge\left(\sigma_{1} \oplus \sigma_{2}\right)\left(u_{2}, v_{2}\right) \\
& -\left(\mu_{1} \oplus \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)
\end{aligned}
$$

$$
\begin{aligned}
&=\left(\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right)\right) \wedge\left(\sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{2}\right)\right)-0 \\
& \text { since }\left(v_{1}, v_{2}\right) \in X_{2} \text { as } G_{2} \text { is complete } \\
&=\left(\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right) \wedge \sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{2}\right)\right), \\
&\left(\mu_{1} \wedge \mu_{2}\right)\left(\left(u_{1}, v_{1}\right),\left(u_{2}, v_{2}\right)\right)=\left(\sigma_{1}\left(u_{1}\right) \wedge \sigma_{2}\left(v_{1}\right) \wedge \sigma_{1}\left(u_{2}\right) \wedge \sigma_{2}\left(v_{2}\right)\right) \quad \text { by }
\end{aligned}
$$

Case (iii)(a)).
Thus, in all cases, $\overline{G_{1} \oplus G_{2}} \cong G_{1} \wedge G_{2}$.
In general, $\overline{G_{1} \oplus G_{2}} \neq G_{1} \wedge G_{2}$. This is shown in the following example:

## Example 3.14.

## 4. Conclusion

The theory on properties between some operations of fuzzy graphs $G_{1}$ and $G_{2}$ has been analyzed in this context. It is proved that these properties exist when $G_{1}$ and $G_{2}$ are complete fuzzy graphs. It is established that when $G_{1}$ and $G_{2}$ are complete, the operation symmetric difference is strong and when $G_{1}$ and $G_{2}$ are strong, the operation conjunction is strong. From Theorem 3.6 and Theorem 3.9, it is quite evident that the complement of composition of $G_{1}$ and $G_{2}$ and the symmetric difference of the complement of $G_{1}$ and $G_{2}$ are neighbourly irregular fuzzy graphs.
